The first real serious outbreak of the disease related to this great war is a form called 'Spanish Influenza', which has caused extraordinary mortality in New York and New England. At the center of this problem, the term 'Spanish Influenza' is really an error, and this is more related to 'American Influenza', the epidemic spread of the disease in the U.S. that has swept across the country. It has spread much more in this country, and the course of which is broken by the presence of some of the factors that have led to the spread of this disease - overcrowding, poor sanitation, and unsanitary conditions.

This disease generally known as the 'Spanish Influenza' is the great plague which caused the greatest amount of death during the war. It first appeared in Great Britain, and it spread to other countries, such as France, Belgium, and Italy. Fortunately our measures of prevention have been more effective than those of past years in America. In addition, the development of a vaccine against the disease has been a great help in preventing its spread.
