ADVICE TO "FLU" CONVALESCENTS

SPAIN AND ENGLAND REPORT INCREASE IN TUBERCULOSIS AFTER INFLUENZA EPIDEMIC

U.S. Public Health Service Warns Public Against Tuberculosis. One Million Cases of Tuberculosis in United States—Each a Source of Danger.

Influenza Convalescents Should Have Lungs Examined—Colds Which Hang Over Cases of Tuberculosis. No Cause for Alarm if Atephile.

Recognized Early—Patient Must Not Be Treated as a Common Cough Case Only.

Washington, D.C. (Special)—According to reports received in the United States Public Health Service, the epidemic of influenza in Spain has had fatal sequelae in the case of many persons from pulmonary tuberculosis instead of influenza. A similar association was recently made by Sir Arthur Newland, the chief medical officer of the United States Public Health Service, who has been attending recently a number of cases of tuberculosis in Spain and in this country. The report of the United States Public Health Service has just been issued on the subject of influenza in Spain, and it contains a statement to the effect that "the public are in a very serious position in this country and much suffering". The United States Public Health Service has issued a statement to the effect that "the public are in a very serious position in this country and much suffering".

The Symptom of Influenza—Attention is called to the fact that the most common symptom of influenza is a fever that is not accompanied by any other symptoms. The disease is not contagious. It is not known to spread from person to person, and is not spread by the air. It is not contagious and is not spread from person to person, and is not spread by the air.

Influenza Convalescents—Attention is called to the fact that many persons who have recovered from influenza have a tendency to become tuberculous. They should, therefore, be watched carefully and treated promptly if they show any symptoms of tuberculosis.
